

**Short protocol** (29.05.2017)

## ***Deprotection of Thiol-modified Oligonucleotides***

---

Prior to use cleave the disulfide bond with 100 mM DTT (pH 8,3 – 8,5) at room temperature for about 30 minutes. Thiol-modified deprotected oligonucleotides should be kept either under an inert atmosphere or in a solution containing DTT (10 mM) to avoid disulfide formation.
